Precaution for Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER"

The Supplemental Restraint System such as “AIR BAG” and “SEAT BELT PRE-TENSIONER”, used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. This system includes seat belt switch inputs and dual stage front air bag modules. The SRS system uses the seat belt switches to determine the front air bag deployment, and may only deploy one front air bag, depending on the severity of a collision and whether the front occupants are belted or unbelted.

Information necessary to service the system safely is included in the “SRS AIR BAG” and “SEAT BELT” of this Service Manual.

WARNING:

- To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision that would result in air bag inflation, all maintenance must be performed by an authorized NISSAN/INFINITI dealer.
- Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the “SRS AIR BAG”.
- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.

PRECAUTIONS WHEN USING POWER TOOLS (AIR OR ELECTRIC) AND HAMMERS

WARNING:

- When working near the Air Bag Diagnosis Sensor Unit or other Air Bag System sensors with the ignition ON or engine running, DO NOT use air or electric power tools or strike near the sensor(s) with a hammer. Heavy vibration could activate the sensor(s) and deploy the air bag(s), possibly causing serious injury.
- When using air or electric power tools or hammers, always switch the ignition OFF, disconnect the battery, and wait at least 3 minutes before performing any service.

Precaution Necessary for Steering Wheel Rotation after Battery Disconnect

NOTE:

- Before removing and installing any control units, first turn the push-button ignition switch to the LOCK position, then disconnect both battery cables.
- After finishing work, confirm that all control unit connectors are connected properly, then re-connect both battery cables.
- Always use CONSULT-III to perform self-diagnosis as a part of each function inspection after finishing work. If a DTC is detected, perform trouble diagnosis according to self-diagnosis results.
- For vehicle with steering lock unit, if the battery is disconnected or discharged, the steering wheel will lock and cannot be turned. If turning the steering wheel is required with the battery disconnected or discharged, follow the operation procedure below before starting the repair operation.

OPERATION PROCEDURE

1. Connect both battery cables.
   **NOTE:**
   Supply power using jumper cables if battery is discharged.
2. Turn the push-button ignition switch to ACC position.
   (At this time, the steering lock will be released.)
3. Disconnect both battery cables. The steering lock will remain released with both battery cables disconnected and the steering wheel can be turned.
4. Perform the necessary repair operation.
5. When the repair work is completed, re-connect both battery cables. With the brake pedal released, turn the push-button ignition switch from ACC position to ON position, then to LOCK position. (The steering wheel will lock when the push-button ignition switch is turned to LOCK position.)

6. Perform self-diagnosis check of all control units using CONSULT-III.
PREPARATION

Special Service Tools

The actual shapes of Kent-Moore tools may differ from those of special service tools illustrated here.

BCM
The ignition switch signal (ACC/ON) is transmitted to driver seat control unit via CAN communication.

Driver seat control unit
The ignition switch signal (ACC/ON) is transmitted to automatic drive positioner control unit via UART communication.

TCM
The A/T shift position signal is transmitted to driver seat control unit via CAN communication.
DOOR MIRROR SYSTEM : System Description

MANUAL FUNCTION

Description
• Automatic drive positioner control unit controls door mirror.
• Automatic drive positioner control unit inputs changeover switch signal and perform the LH/RH control of door mirror motor supplying electric power when changeover switch is operated.
• Automatic drive positioner control unit inputs mirror switch signal and supplies electric power to door mirror.
• The ignition switch signal (ACC/ON) is transmitted from BCM to driver seat control unit via CAN communication and from driver seat control unit to automatic drive positioner control unit via UART communication.

Operation Conditions
If the following conditions are not satisfied, operation is not performed.
• Ignition switch: ON or ACC
• Changeover switch: Select either left or right

REVERSE INTERLOCK DOOR MIRROR SYSTEM

Description
• Select either of the door mirror faces by changeover switch, and then set mirror face downward.
• When ignition switch is ON position and A/T shift selector is in R position, TCM sends the R signal to driver seat control unit.
• The R signal is transmitted to automatic drive positioner control unit from driver seat control unit via UART communication.
• When the R signal is detected, automatic drive positioner control unit activated mirror motor.

Operation Conditions
If the following conditions are not satisfied, operation is not performed.
• Ignition switch: ON
• Changeover switch: Select either left or right
SYSTEM

< SYSTEM DESCRIPTION >

• A/T shift selector: R position

NOTE:
During the reverse interlock door mirror system, if all of the above conditions are not satisfied, mirror face returns to original angle.

AUTO ANTI-DAZZLING INSIDE MIRROR SYSTEM

AUTO ANTI-DAZZLING INSIDE MIRROR SYSTEM : System Description

The sensor built in inside mirror detects the brightness of headlight of the vehicle behind and automatically changes the light transmission to decrease the brightness.

BASIC INSPECTION

DIAGNOSIS AND REPAIR WORKFLOW

Work Flow

DETAILED FLOW

1. OBTAIN INFORMATION ABOUT SYMPTOM

Interview the customer to obtain the malfunction information (conditions and environment when the malfunction occurred) as much as possible when the customer brings the vehicle in.

   >> GO TO 2.

2. CHECK DTC

Perform self-diagnosis for automatic drive positioner (ADP) with CONSULT-III.

Is any DTC detected?

   YES >> Refer to ADP-33, "DTC Index"
   NO  >> GO TO 3.

3. REPRODUCE THE MALFUNCTION INFORMATION

Check the malfunction on the vehicle that the customer describes.
Inspect the relation of the symptoms and the condition when the symptoms occur.

   >> GO TO 4.

4. IDENTIFY THE MALFUNCTIONING SYSTEM WITH "SYMPTOM DIAGNOSIS"

Use "Symptom diagnosis" from the symptom inspection result in step 3. Then identify where to start performing the diagnosis based on possible causes and symptoms.

   >> GO TO 5.

5. IDENTIFY MALFUNCTIONING PARTS WITH "COMPONENT DIAGNOSIS"

Perform the diagnosis with "Component diagnosis" of the applicable system.

   >> GO TO 6.

6. REPAIR OR REPLACE THE MALFUNCTIONING PARTS

Repair or replace the specified malfunctioning parts.

   >> GO TO 7.

7. FINAL CHECK

Check that malfunctions are not reproduced when obtaining the malfunction information from the customer, referring to the symptom inspection result in step 3.

Are all malfunctions corrected?

   YES  >> INSPECTION END
   NO   >> GO TO 4.
1. CHECK OPEN/CLOSE SWITCH

1. Turn ignition switch OFF.
2. Disconnect power window main switch (door mirror remote control switch) connector.
3. Check continuity between power window main switch (door mirror remote control switch) terminals.

### [Driver side]

<table>
<thead>
<tr>

<td>21</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>18</td>
<td></td>
</tr>
</tbody>
</table>

Is the inspection result normal?
YES >> INSPECTION END
NO  >> Replace power window main switch (door mirror remote control switch). Refer to INT-31, "FRONT DOOR FINISHER : Removal and Installation".
< SYMPTOM DIAGNOSIS >

REVERSE INTERLOCK DOOR MIRROR DOES NOT OPERATE

Diagnosis Procedure

1. CHECK DOOR MIRROR (MANUAL FUNCTION)

Check door mirror function with power window main switch (door mirror remote control switch).
Refer to ADP-136, "DOOR MIRROR : Diagnosis Procedure".

Is the inspection result normal?

YES  >> GO TO 2.
NO    >> Repair or replace the malfunctioning parts.

2. CHECK DTC

Check DTC for TCM.
Refer to TM-74, "DTC Index".

Is the inspection result normal?

YES  >> GO TO 3.
NO    >> Repair or replace the malfunctioning parts.

3. CONFIRM THE OPERATION

Confirm the operation again.

Is the result normal?

YES  >> Check intermittent incident. Refer to GI-38, "Intermittent Incident".
NO    >> GO TO 1.
SQUEAK AND RATTLE TROUBLE DIAGNOSES

SYMPTOM DIAGNOSIS

WORK FLOW

CUSTOMER INTERVIEW

Interview the customer if possible, to determine the conditions that exist when the noise occurs. Use the Diag-
nostic Worksheet during the interview to document the facts and conditions when the noise occurs and any
customer comments. Refer to MIR-33, "Diagnostic Worksheet". This information is necessary to duplicate the
conditions that exist when the noise occurs.

• The customer may not be able to provide a detailed description or the location of the noise. Attempt to obtain
all the facts and conditions that exist when the noise occurs (or does not occur).

• If there is more than one noise in the vehicle, perform a diagnosis and repair the noise that the customer is
concerned about. This can be accomplished by performing a test drive with the customer.

• After identifying the type of noise, isolate the noise in terms of its characteristics. The noise characteristics
are provided so that the customer, service adviser, and technician use the same language when describing
the noise.

• Squeak – (Like tennis shoes on a clean floor)
  Squeak characteristics include the light contact / fast movement / brought on by road conditions / hard sur-
faces = high-pitched noise / softer surfaces = low-pitched noises / edge to surface = chirping

• Creak – (Like walking on an old wooden floor)
  Creak characteristics include firm contact / slow movement/twisting with a rotational movement / pitch
dependent on materials / often brought on by activity.

• Rattle – (Like shaking a baby rattle)
  Rattle characteristics include fast repeated contact / vibration or similar movement / loose parts/missing clip
or fastener / incorrect clearance.

• Knock – (Like a knock on a door)
  Knock characteristics include hollow sounds / sometimes repeating / often brought on by driver action.

• Tick – (Like a clock second hand)
  Tick characteristics include gentle contacting of light materials / loose components / can be caused by driver
action or road conditions.

• Thump – (Heavy, muffled knock noise)
  Thump characteristics include softer knock / dull sounds often brought on by activity.

• Buzz – (Like a bumblebee)
  Buzz characteristics include high frequency rattle / firm contact.

• Often the degree of acceptable noise level varies depending upon the person. A noise that a technician may
judge as acceptable may be very irritating to a customer.

• Weather conditions, especially humidity and temperature, may have a great effect on noise level.

DUPLICATE THE NOISE AND TEST DRIVE

If possible, drive the vehicle with the customer until the noise is duplicated. Note any additional information on
the Diagnostic Worksheet regarding the conditions or location of the noise. This information can be used to
duplicate the same conditions when the repair is reconfirmed.
< SYMPTOM DIAGNOSIS >

If the noise can be duplicated easily during the test drive, to help identify the source of the noise, try to duplicate the noise with the vehicle stopped by doing one or all of the following items:

1) Close a door.
2) Tap or push/pull around the area where the noise appears to be coming from.
3) Rev the engine.
4) Use a floor jack to recreate vehicle “twist”.
5) At idle, apply engine load (electrical load, half-clutch on M/T models, drive position on A/T models).
6) Raise the vehicle on a hoist and hit a tire with a rubber hammer.
   • Drive the vehicle and attempt to duplicate the conditions the customer states exist when the noise occurs.
   • If it is difficult to duplicate the noise, drive the vehicle slowly on an undulating or rough road to stress the vehicle body.

CHECK RELATED SERVICE BULLETINS

After verifying the customer concern or symptom, check ASIST for Technical Service Bulletins (TSBs) related to the concern or symptom.

If a TSB relates to the symptom, follow the procedure to repair the noise.

LOCATE THE NOISE AND IDENTIFY THE ROOT CAUSE

1. Narrow down the noise to a general area. To help pinpoint the source of the noise, use a listening tool (Chassis ear: J-39570, engine ear, and mechanics stethoscope).
2. Narrow down the noise to a more specific area and identify the cause of the noise by:
   • Removing the component(s) in the area that is / are suspected to be the cause of the noise. Do not use too much force when removing clips and fasteners, otherwise clips and fasteners can be broken or lost during the repair, resulting in the creation of new noise.
   • Tapping or pushing/pulling the component(s) that is / are suspected to be the cause of the noise. Do not tap or push/pull the component(s) with excessive force, otherwise the noise is eliminated only temporarily.
   • Feeling for a vibration by hand by touching the component(s) that is / are suspected to be the cause of the noise.
   • Placing a piece of paper between components that are suspected to be the cause of the noise.
   • Looking for loose components and contact marks.
      Refer to MIR-31, “Inspection Procedure”.

REPAIR THE CAUSE

• If the cause is a loose component, tighten the component securely.
• If the cause is insufficient clearance between components:
   - Separate components by repositioning or loosening and retightening the components, if possible.
   - Insulate components with a suitable insulator such as urethane pads, foam blocks, felt cloth tape, or urethane tape. A NISSAN Squeak and Rattle Kit (J-43980) is available through the authorized NISSAN Parts Department.

CAUTION: Never use excessive force as many components are constructed of plastic and may be damaged.

NOTE: Always check with the Parts Department for the latest parts information.
The following materials are contained in the NISSAN Squeak and Rattle Kit (J-43980). Each item can be ordered separately as needed.

URETHANE PADS [1.5 mm (0.059 in) thick]
Insulates connectors, harness, etc.
• 76269-9E005: 100 × 135 mm (3.937 × 5.315 in)
• 76884-71L01: 60 × 85 mm (2.362 × 3.346 in)
• 76884-71L02: 15 × 25 mm (0.591 × 0.984 in)
INSULATOR (Foam blocks)
Insulates components from contact. Can be used to fill space behind a panel.
• 73982-9E000: 45 mm (1.772 in) thick, 50 × 50 mm (1.969 × 1.969 in)
• 73982-50Y00: 10 mm (0.394 in) thick, 50 × 50 mm (1.969 × 1.969 in)
INSULATOR (Light foam block)
80845-71L00: 30 mm (1.181 in) thick, 30 × 50 mm (1.181 × 1.969 in)
FELT CLOHTAPE
Used to insulate where movement does not occur. Ideal for instrument panel applications.
• 68370-4B000: 15 × 25 mm (0.591 × 0.984 in) pad
• 68239-13E00: 5 mm (0.197 in) wide tape roll
The following materials, not found in the kit, can also be used to repair squeaks and rattles.

UHMW (TEFLON) TAPE
Insulates where slight movement is present. Ideal for instrument panel applications.

SILICONE GREASE
Used in place of UHMW tape that is visible or does not fit. Only lasts a few months.

SILICONE SPRAY
Used when grease cannot be applied.

DUCT TAPE
Used to eliminate movement.

CONFIRM THE REPAIR
After repair is complete, test drive the vehicle to confirm that the cause of noise is repaired by test driving the vehicle. Operate the vehicle under the same conditions as when the noise originally occurred. Refer to the notes on the Diagnostic Worksheet.

Inspection Procedure

Refer to Table of Contents for specific component removal and installation information.

INSTRUMENT PANEL
Most incidents are caused by contact and movement between:
1. The cluster lid A and instrument panel
2. Acrylic lens and combination meter housing
3. Instrument panel to front pillar garnish
4. Instrument panel to windshield
5. Instrument panel mounting pins
6. Wiring harnesses behind the combination meter
7. A/C defroster duct and duct joint

These incidents can usually be located by tapping or moving the components to duplicate the noise or by pressing on the components while driving to stop the noise. Most of these incidents can be repaired by applying felt cloth tape or silicon spray (in hard to reach areas). Urethane pads can be used to insulate wiring harness.

CAUTION:
Never use silicone spray to isolate a squeak or rattle. If the area is saturated with silicone, the recheck of repair becomes impossible.

CENTER CONSOLE
Components to check include:
1. Shifter assembly cover to finisher
2. A/C control unit and cluster lid C
3. Wiring harnesses behind audio and A/C control unit

The instrument panel repair and isolation procedures also apply to the center console.

DOORS
Check the following items:
1. Finisher and inner panel making a slapping noise
2. Inside handle escutcheon connection to door finisher
3. Wiring harnesses tapping
4. Door striker out of alignment causing a popping noise on starts and stops

Tapping, moving the components, or pressing on them while driving to duplicate the conditions can isolate many of these incidents. The areas can usually be insulated with felt cloth tape or insulator foam blocks from the NISSAN Squeak and Rattle Kit (J-43980) to repair the noise.

TRUNK
Trunk noises are often caused by a loose jack or loose items put into the trunk by the customer.
In addition check for the following items:
1. Trunk lid dumpers out of adjustment
2. Trunk lid striker out of adjustment
SQUEAK AND RATTLE TROUBLE DIAGNOSES

< SYMPTOM DIAGNOSIS >

3. Trunk lid torsion bars knocking together
4. A loose license plate or bracket
Most of these incidents can be repaired by adjusting, securing, or insulating the item(s) or component(s) causing the noise.

SUNROOF/HEADLINING
Noises in the sunroof / headlining area can often be traced to one of the following items:
1. Sunroof lid, rail, linkage, or seals making a rattle or light knocking noise
2. Sunvisor shaft shaking in the holder
3. Front or rear windshield touching headlining and squeaking
Again, pressing on the components to stop the noise while duplicating the conditions can isolate most of these incidents. Repairs usually consist of insulating with felt cloth tape.

SEATS
When isolating seat noise it is important to note the position the seat is in and the load placed on the seat when the noise occurs. These conditions should be duplicated when verifying and isolating the cause of the noise.
Causes of seat noise include:
1. Headrest rods and holder
2. A squeak between the seat pad cushion and frame
3. The rear seatback lock and bracket
These noises can be isolated by moving or pressing on the suspected components while duplicating the conditions under which the noise occurs. Most of these incidents can be repaired by repositioning the component or applying urethane tape to the contact area.

UNDERHOOD
Some interior noise may be caused by components under the hood or on the engine wall. The noise is then transmitted into the passenger compartment.
Causes of transmitted underhood noise include:
1. Any component mounted to the engine wall
2. Components that pass through the engine wall
3. Engine wall mounts and connectors
4. Loose radiator mounting pins
5. Hood bumpers out of adjustment
6. Hood striker out of adjustment
These noises can be difficult to isolate since they cannot be reached from the interior of the vehicle. The best method is to secure, move, or insulate one component at a time and test drive the vehicle. Also, engine RPM or load can be changed to isolate the noise. Repairs can usually be made by moving, adjusting, securing, or insulating the component causing the noise.
Dear Infiniti Customer:
We are concerned about your satisfaction with your Infiniti vehicle. Repairing a squeak or rattle sometimes can be very difficult. To help us fix your Infiniti right the first time, please take a moment to note the area of the vehicle where the squeak or rattle occurs and under what conditions. You may be asked to take a test drive with a service consultant or technician to ensure we confirm the noise you are hearing.

I. WHERE DOES THE NOISE COME FROM? (circle the area of the vehicle)
The illustrations are for reference only, and may not reflect the actual configuration of your vehicle.

Continue to page 2 of the worksheet and briefly describe the location of the noise or rattle. In addition, please indicate the conditions which are present when the noise occurs.
SQUEAK AND RATTLE TROUBLE DIAGNOSES

SQUEAK & RATTLE DIAGNOSTIC WORKSHEET - page 2

Briefly describe the location where the noise occurs:

____________________________________________________________________________________

II. WHEN DOES IT OCCUR? (please check the boxes that apply)

☐ anytime
☐ 1st time in the morning
☐ only when it is cold outside
☐ only when it is hot outside
☐ after sitting out in the rain
☐ when it is raining or wet
☐ dry or dusty conditions
☐ other:

III. WHEN DRIVING:

☐ through driveways
☐ over rough roads
☐ over speed bumps
☐ only about _____ mph
☐ on acceleration
☐ coming to a stop
☐ on turns: left, right or either (circle)
☐ with passengers or cargo
☐ other: ____________________________
☐ after driving _____ miles or _____ minutes

IV. WHAT TYPE OF NOISE

☐ squeak (like tennis shoes on a clean floor)
☐ creak (like walking on an old wooden floor)
☐ rattle (like shaking a baby rattle)
☐ knock (like a knock at the door)
☐ tick (like a clock second hand)
☐ thump (heavy, muffled knock noise)
☐ buzz (like a bumble bee)

DOOR MIRROR ASSEMBLY

DOOR MIRROR ASSEMBLY : Removal and Installation

INFOID:0000000006037403

REMOVAL

CAUTION:

• When removing, always use a remover tool that is made of plastic.
• Be careful not to scratch door mirror body.

1. Remove front door finisher. Refer to INT-31, "FRONT DOOR FINISHER : Removal and Installation".
2. Remove front door sash inner cover. Refer to INT-32, "FRONT DOOR SASH INNER COVER : Removal and Installation".
3. Disconnect door mirror assembly harness connector.

1. Housing
2. Actuator bracket
3. Actuator assembly
4. Glass mirror
5. Base cover
6. Base
7. Side camera finisher
8. Power fold unit
9. Inner cover

*: Pawl

Revised: 2011 M37/M56
4. Remove door mirror assembly mounting nuts, and then remove door mirror assembly.

INSTALLATION
Install in the reverse order of removal.

DOOR MIRROR ASSEMBLY : Disassembly and Assembly

CAUTION:
When removing, always use a remover tool that is made of plastic.

DISASSEMBLY
1. Remove door mirror assembly from front door. Refer to MIR-36, "DOOR MIRROR ASSEMBLY : Removal and Installation".
2. Remove glass mirror. Refer to MIR-38, "GLASS MIRROR : Removal and Installation".
3. Remove actuator assembly (2).

1. Remove inner cover (1) fixing screw (A), and then slide inner cover toward the direction of the arrow to remove.
2. Remove actuator assembly fixing screws (B).
3. Disconnect the harness connectors located behind actuator assembly.

NOTE:
For models with automatic driving position system, disconnect the harness connector (C).

4. Remove base from housing.
   1. Remove base cover with a small flat-bladed screwdriver (A) wrapped into a protective tape.

   CAUTION:
   Apply protective tape (B) around base to protect the painted surface from damage.

2. Remove the mounting TORX bolts.
3. Write a short note to describe connector terminal layout, and then remove all connector terminals from harness connector.
4. Remove base through out harness connector.
5. Remove actuator bracket, power fold unit and side camera finisher.
OUTSIDE MIRROR

< REMOVAL AND INSTALLATION >

1. Remove screws (A) fixing actuator bracket and side camera finisher to the housing.
2. Remove actuator bracket and power fold unit from housing.
3. Disengage the pawls, and then remove side camera finisher from housing.
6. Remove the fixing screws (A), and then remove power fold unit from actuator bracket.

ASSEMBLY
Assemble in the reverse order of disassembly.

GLASS MIRROR

GLASS MIRROR : Removal and Installation

REMOVAL
1. Place the glass mirror upward.
2. Apply a strip of protective tape (B) on housing assembly.
3. As shown in the figure, insert a small flat-bladed screwdriver (A) between glass mirror (1) and actuator (2). Push up both pawls simultaneously to remove glass mirror lower half side.
   NOTE:
   Insert flat-bladed screwdriver into recesses (3), and push up while rotating (twisting) to make work easier.
   CAUTION:
   Apply protective tape (B) around housing to protect the painted surface from damage.
4. Remove both terminals (A) of mirror heater attachment from door mirror (1).

INSTALLATION
Note the following item, and then install in the reverse order of removal.
CAUTION:
After installation, visually check that pawls are securely engaged.
